Table of Contents

Equations and Backgrounds

The semilinear elliptic equation with **singular nonlinearity** is given by

$$\Delta u = u^{-p} + f,\ u \geq 0 \quad \text{in } \Omega \subset \mathbb{R}^n,\ n \geq 2,\ p \geq 0, \tag{SN}$$

where Ω is a domain and $f \in L^1_{\mathrm{loc}}(\Omega)$.

Some mathematical and physical backgrounds are as follows.

1. $p = 0$: $\Delta u = \chi_{\{u>0\}}$, obstacle problem, free boundary problem.
2. $p > 0$:
    - $p > 1$: Thin film theory.
    - $p = 2$: Simplified micro-electromechanical system (MEMS).
    - $p = 1$: Singular minimal hypersurfaces with symmetry.

For $p = 2$, $n = 1$ and $f \equiv 0$, an easy derivation of the model is the dynamical analysis of two homopolar charges under the Coulomb force.

Problems Setting: Motivation

Consider the regularity theory for solutions of (SN) with $p > 0$.

If $u \in C^0$ and $f \in C^\infty$, then

$$x \in \{u > 0\} \;\Rightarrow\; \exists r > 0, \text{ s.t. } \inf_{B_r(x)} u > 0 \;\Rightarrow\; u \in C^\infty(B_r(x)).$$

As a result, $\{u = 0\}$ is the singular set of u.

For the thin film theory, it refers to the **rupture** phenomenon.

Question

How large is the rupture set for a solution of (SN) with $p > 0$? What conditions will we have to obtain such results of rupture sets?

For $0 < p < 1$, solutions behave like those for case $p = 0$. There are almost complete results even for two phases with analogous methods (H. Tavares and S. Terracini, JMPA 2019). Thus, we mainly consider the case $p > 1$.

Problems Setting: Different Solutions

For (SN) with $p > 1$, we have the following definitions.

1. **Weak solution:** $0 \le u \in (H^1_{\mathrm{loc}} \cap L^{-p}_{\mathrm{loc}})(\Omega)$, (SN) is satisfied in the sense of distribution.
2. **Finite energy solution:** $0 \le u \in (C^0_{\mathrm{loc}} \cap H^1_{\mathrm{loc}} \cap L^{1-p}_{\mathrm{loc}})(\Omega)$, and we have (SN) in $\{u > 0\}$, in the sense of distribution.
3. **Stationary solution:** weak solution+stationary condition:

$$\int_\Omega \left[\left(\frac{|\nabla u|^2}{2} - \frac{u^{1-p}}{p-1} \right) \operatorname{div} Y - DY(\nabla u, \nabla u) - f(Y \cdot \nabla u) \right] = 0,$$

$\forall Y \in C_0^\infty(\Omega, \mathbb{R}^n)$.

The corresponding functional of (SN) is

$$\mathcal{F}_f(u, \Omega) := \int_\Omega \left(\frac{|\nabla u|^2}{2} - \frac{u^{1-p}}{p-1} + fu \right).$$

Then

$$\text{Stationary condition} \Leftrightarrow \left.\frac{\mathrm{d}}{\mathrm{d}t}\right|_{t=0} \mathcal{F}_f(u(\cdot + tY(\cdot)), \Omega) = 0.$$

Problems Setting: Present results

Let d_u be the Hausdorff dimension of the rupture set $\{u = 0\}$. The following are some results on the estimate of d_u under different assumptions.

1. **Weak solution:**
   - $d_u \leq n - 2 + \frac{4}{p+2}$ (Jiang-Lin, CAM 2004);
   - $d_u \leq n - 2 + \frac{2}{p+1}$ (Dupaigne-Ponce-Porretta, JAM 2006).
2. **Finite energy solution:**
   - $d_u \leq n - 2 + \frac{4}{p+1}$ (Guo-Wei, CPAA 2008);
   - $d_u \leq n - 2 + \frac{2}{p+1}$ (Dávila-Ponce, CRMAS 2008).
3. **Stationary solution:**
   - $d_u \leq n - 2 + \frac{4}{p+1}$ (Guo-Wei, MM 2006);
   - $d_u \leq n - 2$ (Dávila-Wang-Wei, AIHP 2016).

The best estimate of d_u is achieved for stationary solutions!

Remarks on Results by Dávila-Wang-Wei

Theorem (Dávila-Wang-Wei, AIHP 2016)

Assume that $u \in C^{0,\frac{2}{p+1}}_{\mathrm{loc}}$ is a stationary solution of $\Delta u = u^{-p}$. Then the rupture set $\{u = 0\}$ is a relatively closed set with $d_u \le n-2$. If $n = 2$, then $\{u = 0\}$ is discrete.

Some remarks are as follows.

1. The assumption of $\frac{2}{p+1}$-Hölder continuity is optimal and corresponds to the $C^{1,1}_{\mathrm{loc}}$ regularity in the obstacle problem.
2. It is an a priori result. It is still unknown if a stationary solution must be $\frac{2}{p+1}$-Hölder continuous.
3. The result is **sharp**. If $n = 2$,

$$u(x) = u(|x|) := \left(\frac{2}{p+1}\right)^{-\frac{2}{p+1}} |x|^{\frac{2}{p+1}}$$

is a stationary solution for $\Delta u = u^{-p}$ and $\{u = 0\} = \{0\}$.

Motivation of Our Works

Question

Can we obtain further information about the stationary solutions of (SN)?

Before we present the main results, we introduce the concept of rectifiability. Rectifiable sets can be viewed as manifolds for analyst

Definition (Rectifiability)

Let $N \in \mathbb{Z}_+$ and $k \in \mathbb{Z} \cap [1, N]$. We call a set $M \subset \mathbb{R}^N$ as k-rectifiable if

$$M \subset M_0 \cup \bigcup_{i \in \mathbb{Z}_+} f_i(\mathbb{R}^k),$$

where $\mathcal{H}^k(M_0) = 0$, and $f_i : \mathbb{R}^k \to \mathbb{R}^N$ is a Lipschitz map $\forall i \in \mathbb{Z}_+$.

Theorem (Wang-Zhang, arXiv: 2411.16048)

$\frac{1}{2}+\frac{1}{2p}<\frac{q}{n}$. $u\in C^{0,\frac{2}{p+1}}_{\mathrm{loc}}(B_4)$ is a stationary solution of (SN) with $f\in L^q_{\mathrm{loc}}(B_4)$, satisfying $\|u\|_{L^1(B_2)}+\|f\|_{L^q(B_2)}\le\Lambda$. The following properties hold.

1. *$\exists\varepsilon, C=\varepsilon, C(\Lambda,n,p,q)>0$, s.t.*

$$\mathcal{L}^n(B_r(\{u<\varepsilon r^{\frac{2}{p+1}}\}\cap B_1))\le Cr^2,\quad 0<r<1.$$

2. *If $f\in W^{j-1,\infty}_{\mathrm{loc}}(B_4)$ with $j\in\mathbb{Z}_+$ and $\|f\|_{W^{j-1,\infty}(B_2)}\le\Lambda'$, then*

$$\sup\left\{\lambda>0:\lambda^{\frac{2(p+1)}{j(p+1)-2}}\mathcal{L}^n(\{x\in B_1:|D^ju(x)|>\lambda\})\right\}\le C',$$

where $C'=C'(\Lambda,\Lambda',j,n,p,q)>0$.

3. *$\{u=0\}$ is $(n-2)$-rectifiable, and for $n=2$, $\{u=0\}$ is a discrete set.*

Some Remarks on Our Results

1. We actually estimate the $(n-2)$-dimensional Mikowski r-content for $\{u < \varepsilon r^{\frac{2}{p+1}}\}$. In particular, $\dim_{\mathrm{Min}}(\{u=0\} \cap B_1) \leq n-2$.
2. The $L^{\frac{2(p+1)}{j(p+1)-2},\infty}$ and $(n-2)$-rectifiability of $\{u=0\}$ are both sharp.
3. By standard interpolation,

$$D^j u \in L^{\frac{2(p+1)}{j(p+1)-2}-}(B_1), \quad j \in \mathbb{Z}_+,$$

i.e. $\forall 0 < s < \frac{2(p+1)}{j(p+1)-2}$, $\exists C = C(\Lambda, \Lambda', j, n, p, q, s) > 0$, s.t.

$$\|D^j u\|_{L^s(B_1)} \leq C.$$

For $j=1$, $u \in W^{1,\frac{2(p+1)}{p-1}}(B_1)$, improving the H^1 regularity.

4. In fact, any k-stratum of $\{u=0\}$ is k-rectifiable with $k \in \mathbb{Z} \cap [0, n-2]$. Here, the stratification is based on the tangent function.

Table of Contents

Terminologies of Harmonic maps

$\Omega \subset \mathbb{R}^n$: bounded domain. $\mathcal{N} \hookrightarrow \mathbb{R}^d$ real, smooth, compact manifold, embedded into $\mathbb{R}^d$. **Harmonic map**: the critical point of the variational problem

$$\mathcal{E}(\Phi, \Omega) := \int_\Omega |\nabla \Phi|^2, \quad \Phi = (\Phi^1, \Phi^2, ..., \Phi^d) \in H^1(\Omega, \mathcal{N}).$$

Definition (Local minimizer)

$\Phi \in H^1(\Omega, \mathcal{N})$ is a **local minimizer** of if $\forall B_r(x) \subset\subset \Omega$, and $\Psi \in H^1(B_r(x), \mathcal{N})$ with $\Phi = \Psi$ on $\partial B_r(x)$,

$$\mathcal{E}(\Phi, B_r(x)) \leq \mathcal{E}(\Psi, B_r(x)).$$

Definition (Weakly harmonic map)

$\Phi \in H^1(\Omega, \mathcal{N})$ is a **weakly harmonic map** if $\forall \varphi = (\varphi^i)_{i=1}^d \in C_0^\infty(\Omega, \mathbb{R}^d)$,

$$\int_\Omega (\nabla \Phi \cdot \nabla \varphi - A(\Phi)(\nabla \Phi, \nabla \Phi) \cdot \varphi) = 0,$$

where $A(y)(\cdot, \cdot) : T\mathcal{N} \times T\mathcal{N} \to (T\mathcal{N})^\perp$ is the second fundamental form of $\mathcal{N}$

Definition (Stationary harmonic map)

$\Phi \in H^1(\Omega, \mathcal{N})$ is a **stationary harmonic map** if Φ is a weakly harmonic map and satisfies the stationary condition

$$\int_\Omega (|\nabla\Phi|^2 \operatorname{div} Y - 2DY(\nabla\Phi, \nabla\Phi)) = 0,$$

$\forall Y \in C_0^\infty(\Omega, \mathbb{R}^n)$.

As given previously,

$$\text{Stationary condition} \Leftrightarrow \left.\frac{\mathrm{d}}{\mathrm{d}t}\right|_{t=0} \mathcal{E}(\Phi(\cdot + tY(\cdot)), \Omega) = 0.$$

It is obvious that

$$\text{Local minimizer} \Rightarrow \text{Stationary harmonic map} \Rightarrow \text{Weakly harmonic map.}$$

For a harmonic map $\Phi \in H^1(\Omega, \mathcal{N})$, the singular set is

$$\operatorname{sing}(\Phi) = \{x \in \Omega : \forall r > 0,\ \Phi \text{ is not continuous in } B_r(x)\}.$$

Results on sing(Φ) for Harmonic Maps

1. **Estimates of the Hausdorff dimension:**
   - For **local minimizers**, $\dim_{\mathcal{H}}(\text{sing}(\Phi)) \leq n-3$ (R. Schoen and K. Uhlenbeck, JDG 1982);
   - For **stationary harmonic maps**, $\dim_{\mathcal{H}}(\text{sing}(\Phi)) \leq n-2$ (F. Bethuel, MM 1993).
2. **Rectifiability:**
   - For **local minimizers** with analytic $\mathcal{N}$, sing(Φ) is $(n-3)$-rectifiable and the k-stratum is k-rectifiable (L. Simon, CVPDE 1995);
   - For **stationary harmonic maps**, the concentration set is $(n-2)$-rectifiable (F. Lin, AM 1999);
   - For general smooth $\mathcal{N}$ and **stationary harmonic maps**, sing(Φ) is $(n-2)$-rectifiable, and the k-stratum is k-rectifiable (A. Naber and D. Valtorta, AM 2017).

Remark: The results in (Dávila-Wang-Wei, AIHP 2016) follows from similar arguments in (Schoen and Uhlenbeck, JDG 1982).

Difficulties in the Proof of Rectifiability

Assumption (Simplified model)

$u \in C^{0,\frac{2}{p+1}}_{\mathrm{loc}}$ is a stationary solution of $\Delta u = u^{-p}$ in B_2 with $p > 1$.

For $B_r(x) \subset B_2$, the widely used density is

$$\theta(u; x, r) := r^{\frac{2(p-1)}{p+1} - n} \int_{B_r(x)} \left(\frac{|\nabla u|^2}{2} - \frac{u^{1-p}}{p-1} \right) - \frac{r^{-\frac{4}{p+1} - n}}{p+1} \int_{\partial B_r(x)} u^2.$$

Moreover, it satisfies the **monotonicity formula**

$$\frac{\mathrm{d}}{\mathrm{d}r} \theta(u; x, r) = r^{-\frac{4}{p+1} - n} \int_{\partial B_r(x)} \left| (y - x) \cdot \nabla u - \frac{2u}{p+1} \right|^2 \mathrm{d}\mathcal{H}^{n-1}(y) \geq 0.$$

$$x \in \{u > 0\} \ \Leftrightarrow \ \lim_{r \to 0^+} \theta(u; x, r) = -\infty.$$

$\theta(u; x, r)$ **can be negative!**

All the previous arguments in harmonic maps require the nonnegativity of the density!

Blow up analysis I

Classical blow-ups. (Dávila-Wang-Wei, AIHP 2016) For $x \in B_2$,

$$u_{x,r}(y) := \frac{u(x+ry)}{r^{\frac{2}{p+1}}}.$$

1. If $x \in \{u = 0\}$, then $\exists r_i \to 0^+$, s.t.

   $$u_{x,r_i} \to u_\infty \text{ strongly in } H^1_{\mathrm{loc}} \cap L^\infty_{\mathrm{loc}} \cap L^{-p}_{\mathrm{loc}},$$

   where $\Delta u_\infty = u_\infty^{-p}$ is a stationary solution.
2. If $x \in \{u > 0\}$, then

   $$u_{x,r} \to +\infty \text{ locally and uniformly}, \ \ r \to 0^+.$$

For $x \in \{u > 0\}$, the blow-ups do not have a limit!

Stratification I

Definition (k-symmetric function)

$k \in \mathbb{Z} \cap [0, n]$. $h \in C^{0,\frac{2}{p+1}}_{\mathrm{loc}}(\mathbb{R}^n))$ is k-symmetric at $x \in \mathbb{R}^n$ wrt $V \subset \mathbb{R}^n$ with $\dim V = k$ if h is $\frac{2}{p+1}$-homogeneous at x and invariant with respect to V. If $x = 0$, we call that h is k-symmetric.

Definition (Stratification I)

$\forall k \in \mathbb{Z} \cap [0, n-1]$, define the k-stratum of u by

$$S^k_{(\mathrm{I})}(u) := \{x \in \{u = 0\} : \text{no tangent function } v \text{ of } u \text{ at } x \text{ is } (k+1)\text{-symmetric}\}.$$

As a result,

$$S^0_{(\mathrm{I})}(u) \subset S^1_{(\mathrm{I})}(u) \subset S^2_{(\mathrm{I})}(u) \subset ... \subset S^{n-1}_{(\mathrm{I})}(u) = \{u = 0\}.$$

Indeed,

$$S^0_{(\mathrm{I})}(u) \subset S^1_{(\mathrm{I})}(u) \subset S^2_{(\mathrm{I})}(u) \subset ... \subset S^{n-2}_{(\mathrm{I})}(u) = S^{n-1}_{(\mathrm{I})}(u) = \{u = 0\}.$$

Rectifiability: Idea

After (A. Naber and D. Valtorta, AM 2017), in (A. Naber and D. Valtorta, MZ 2018), the same authors developed simplified arguments only requiring the boundedness of the density.

For u satisfying the assumption of the simplified model,

$$\theta_r(u; x, r) \text{ is locally bounded.}$$

Idea: Restrict the analysis on the rupture set and apply methods by A. Naber and D. Valtorta.

Rectifiability: Modified Densities

Following (J. Hirsch, S. Stuvard, and D. Valtorta, TAMS 2019), we also modify the density $\theta_r(u; x, r)$ by

$$\vartheta(u; x, r) = r^{\frac{2(p-1)}{p+1} - n} \int_{\mathbb{R}^n} \left(\frac{|\nabla u|^2}{2} - \frac{u^{1-p}}{p-1} \right) \phi_{x,r} + \frac{2r^{-\frac{4}{p+1} - n}}{p+1} \int_{\partial B_r(x)} u^2 \dot{\phi}_{x,r}.$$

Definition

Let $\phi : [0, +\infty) \to [0, +\infty)$.

- $\operatorname{supp} \phi \subset [0, 10)$.
- $\phi(t) \geq 0$, and $|\phi'(t)| \leq 100$, $\forall t \in [0, +\infty)$.
- $-2 \leq \phi'(t) \leq -1$, $\forall t \in [0, 8]$.

For $x \in \mathbb{R}^n$,

$$\phi_{x,r}(y) := \phi\left(\frac{|y-x|^2}{r^2}\right), \quad \dot{\phi}_{x,r}(y) := \phi'\left(\frac{|y-x|^2}{r^2}\right).$$

Such a modification can avoid the application of **unique continuation**.

Difficulties in the Proof of Regularity Improvement

To enhance the regularity, we have to obtain.

$$\mathcal{L}^n(B_r(\{u < \varepsilon r^{\frac{2}{p+1}}\} \cap B_1)) \leq C\left([u]_{C^{0,\frac{2}{p+1}}}, n, p\right) r^2.$$

Indeed, it is easy to obtain

$$\mathcal{L}^n(B_r(\{u = 0\} \cap B_1)) \leq C\left([u]_{C^{0,\frac{2}{p+1}}}, n, p\right) r^2.$$

Difficulty: The density does not have a uniform bound in $\{u < \varepsilon r^{\frac{2}{p+1}}\}$.

For u and $B_r(x) \subset \{u > 0\}$, we have the **Nondegeneracy**

$$\sup_{B_r(x)} u \geq C'\left([u]_{C^{0,\frac{2}{p+1}}}, n, p\right) r^{\frac{2}{p+1}}.$$

Note that we actually need the one with "inf" replacing "sup".

Blow up analysis II and Stratification II

Refined blow-ups. For $x \in B_2$, let

$$\widetilde{u}_{x,r}(y) := \frac{u(x+ry) - u(x)}{r^{\frac{2}{p+1}}}.$$

1. If $x \in \{u = 0\}$, then $\exists r_i \to 0^+$, s.t.

$$\widetilde{u}_{x,r_i} \to u_\infty \text{ strongly in } H^1_{\text{loc}} \cap L^\infty_{\text{loc}} \cap L^{-p}_{\text{loc}},$$

where $\Delta u_\infty = u_\infty^{-p}$ is a stationary solution.

2. If $x \in \{u > 0\}$, then

$$\widetilde{u}_{x,r} \to 0 \text{ strongly in } H^1_{\text{loc}} \cap L^\infty_{\text{loc}}, \;\; r \to 0^+.$$

Definition (Stratification II)

$\forall k \in \mathbb{Z} \cap [0, n-1]$, define the k-stratum of u by

$$S^k_{(\text{II})}(u) := \{x \in B_2 : \text{no tangent function } v \text{ of } u \text{ at } x \text{ is } (k+1)\text{-symmetric}\}.$$

$$S^0_{(\text{II})}(u) \subset S^1_{(\text{II})}(u) \subset S^2_{(\text{II})}(u) \subset \ldots \subset S^{n-1}_{(\text{II})}(u) = B_2.$$

Alternative Results: Intuition

We will deal with points in B_2 through an **alternative method**.

1. If $0 \leq u(x) \ll r^{\frac{2}{p+1}}$, then the behavior of u within $B_r(x)$ is like the case that $u(x) = 0$. Thus, we apply methods in line with (A. Naber and D. Valtorta, MZ 18).
2. If $u(x) \gtrsim r^{\frac{2}{p+1}}$, we use the standard regularity theory for elliptic equations to find a small ball $B_{\delta r}(x)$ with $\delta \ll 1$ s.t. u exhibits nice properties.

Quantitative Stratification: Definitions

Definition (Quantitative symmetry)

$\varepsilon > 0$, and $k \in \mathbb{Z} \cap [0, n]$. u is (k, ε)-symmetric in $B_r(x) \subset\subset B_2$, if there is a k-symmetric function $h \in C^{0,\frac{2}{p+1}}_{\text{loc}}(\mathbb{R}^n)$ s.t $\|\widetilde{u}_{x,r} - h\|_{L^\infty(B_1)} < \varepsilon$.

Definition (Quantitative stratification)

$\varepsilon > 0$, $k \in \mathbb{Z} \cap [0, n-1]$, and $0 < r < 1$, the k-th (ε, r)-stratification of u, denoted by $S^k_{\varepsilon,r}(u)$, is

$$S^k_{\varepsilon,r}(u) := \{x \in B_1 : u \text{ is not } (k+1, \varepsilon)\text{-symmetric in } B_s(x) \text{ for any } r \le s < 1\}.$$

In fact,

$$S^k_{(\text{II})}(u) \cap B_1 = \bigcup_{\varepsilon>0} S^k_\varepsilon(u) = \bigcup_{\varepsilon>0} \bigcap_{0<r<1} S^k_{\varepsilon,r}(u).$$

Theorem (Main)

$\varepsilon > 0$ and $k \in \mathbb{Z} \cap [0, n-2]$. Assume that $[u]_{C^{0,\frac{2}{p+1}}(\overline{B}_2)} \leq \Lambda$. If $0 < r < 1$, then

$$\mathcal{L}^n(B_r(S^k_{\varepsilon,r}(u))) \leq C(\varepsilon, \Lambda, n, p) r^{n-k}.$$

1. This theorem is sharp, giving paralleled results as harmonic maps.
2. The result implies the Ahlfors regularity of $S^k_\varepsilon(u)$ and then the rectifiability.
3. The proof of

$$\mathcal{L}^n(B_r(S^k_{\varepsilon,r}(u) \cap \{u = 0\})) \leq C(\varepsilon, \Lambda, n, p) r^{n-k}$$

is much easier and enough to obtain the rectifiability of $S^k(u)$. However, it is not sufficient to obtain the improvement of regularity.

Quantitative Stratification: Lemmas I

By simple compactness arguments, we have:

Lemma

$[u]_{C^{0,\frac{2}{p+1}}(\overline{B}_2)} \leq \Lambda$. $\exists \varepsilon = \varepsilon(\Lambda, n, p) > 0$ *s.t.* $\forall 0 < r < 1$

$$\{x \in B_1 : u(x) < \varepsilon r^{\frac{2}{p+1}}\} \subset S^{n-2}_{\varepsilon,r}(u).$$

By the estimate of $S^k_{\varepsilon,r}(u)$, this lemma implies that

$$\begin{aligned}\mathcal{L}^n(\{x \in B_1 : u(x) < \varepsilon r^{\frac{2}{p+1}}\}) &\leq \mathcal{L}^n(B_r(S^{n-2}_{\varepsilon,r}(u))) \\ &\leq C(\varepsilon, \Lambda, n, p) r^{n-(n-2)} \\ &\leq C(\varepsilon, \Lambda, n, p) r^2.\end{aligned}$$

Quantitative Stratification: Lemma II

The key step in obtaining our main theorem is the following alternative lemma. The rest of the proof is a simple application of arguments by A. Naber and D. Valtorta.

Lemma

$k \in \mathbb{Z} \cap [0, n-2]$, $0 < s \leq 1$, and $x \in \mathbb{R}^n$. $[u]_{C^{0,\frac{2}{p+1}}(\overline{B}_{15s}(x))} \leq \Lambda$. $\forall \varepsilon > 0$, there exist $\delta, \delta' = \delta, \delta'(\varepsilon, \Lambda, n, p) > 0$ s.t. either

$$\inf_{V \subset \mathbb{R}^n,\ \dim V = k+1} \left(s^{\frac{2(p-1)}{p+1} - n} \int_{B_s(x)} |V \cdot \nabla u|^2 \right) < \delta,$$

or there is $s_x \in [\delta' s, s]$ s.t. u is $(k+1, \varepsilon)$-symmetric in $B_{s_x}(x)$.

1. For harmonic maps, the proof is simple.
2. If we use $u_{x,r}$ to define quantitative stratification, we cannot obtain such a result without assuming that $u(x) = 0$.

Quantitative Stratification: Lemma III

Lemma

$k \in \mathbb{Z} \cap [0, n-2]$, $0 < r \leq 1$, and $x \in \mathbb{R}^n$. $[u]_{C^{0,\frac{2}{p+1}}(\overline{B}_{15r}(x))} \leq \Lambda$. $\forall \varepsilon > 0$, there are $\delta = \delta(\varepsilon, \Lambda, n, p) > 0$ and $\gamma = \gamma(n, p) > 0$ s.t. if

$$\inf_{V \subset \mathbb{R}^n,\ \dim V = k+1} \left(r^{\frac{2(p-1)}{p+1} - n} \int_{B_r(x)} |V \cdot \nabla u|^2 \right) < \delta,$$

then either $u(x) \geq \delta^\gamma r^{\frac{2}{p+1}}$, or $\exists r_x \in [\delta^\gamma r, r]$ s.t. u is $(k+1, \varepsilon)$-symmetric in $B_{r_x}(x)$.

1. The idea of the proof is to first let $\sigma > 0$ and assume that $u(x) < \sigma r^{\frac{2}{p+1}}$. By compactness arguments, if $\sigma \ll 1$, then u is $(k+1, \varepsilon)$-symmetric.
2. By this lemma, if $u(x) \geq \delta^\gamma r^{\frac{2}{p+1}}$, we can use the regularity theory of elliptic equations to obtain that in a smaller ball with radius which is comparable to r_x, u is $(k+1, \varepsilon)$-symmetric.

Thank you for listening!
